

Ongoing Use

- Once you have successfully completed the initial set-up, you can turn your TV On by clicking the On button of your TV remote control twice.
- 1st Press of the remote control reconnects mains power and allows the TV and Slave appliances to come into Standby Power Mode. At this time the Red Standby Lights of the appliances will illuminate.
- 2nd Press turns the TV On.
- You can now use your slave appliance as normal provided the 'Master' TV is On.
- When you have finished watching your TV, turn your TV off via the remote as you normally would. This will turn your TV into Standby. After approximately 75 seconds the Standby Power Controller (SPC) will cut all power to all Master and Slave appliances. Note that in some occasions this may take longer if your TV has a "Step Down Mode".
- You are now saving electricity and money by preventing wasted Standby Power
- This SPC also saves power in the event people do not turn Off the TV e.g. when they leave the room, or fall asleep in front of the TV etc. If after 57 minutes the SPC has not received an IR signal, the IR receiver will flash for 3 minutes. This is a warning that the device is about to turn Off the TV and associated Slaves. If you are watching the TV, simply press any IR remote control button. The flashing will stop and the TV and associated appliances will not turn off.

For Further Help

- Call the Company who installed your unit or check FAQs and troubleshooting at www.emeraldplanet.com.au
- Only plug appropriate appliances into the Standby Power Controller (SPC). If in doubt check the manufacturer's user manual for instructions.

SAVE Power SAVE Money

SmartPowerBoard

Super Energy Saver For TV/AV

Quick Guide - Everyday Use

①

②

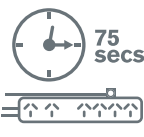

Turning On

- Click the TV Remote once, this activates the powerboard.
- Click the TV Remote a second time, this turns on your TV.

Turning Off

①

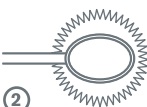

②

- Turn off the TV with your TV Remote, as you usually do. The TV will now be in Standby mode.
- After 75 seconds (usually) the TV and all Slave appliances will be disconnected from mains electricity. **You are now saving power.**

Timer (Unintended Use)

①

②

③

- The powerboard also saves power when people forget to turn off the TV or leave the room.
- Generally, if you are watching the TV this will never bother you. However, if you watch the TV for more than 57 minutes without pressing any buttons on your IR Remote the powerboard may think you are not watching TV or have left the room.
- In this scenario the IR Receiver will flash for 3 minutes
- If you are still watching the TV, press any button on your IR Remote to let the IR Receiver know you want to keep the TV on.
e.g. use the IR Remote to turn the volume up & down.

Useful Tips

- Always ensure the IR Receiver is directly in view so that IR Remotes can activate the IR Receiver.
- Sometimes it takes longer than 75 seconds after you turn off the TV for both the TV and Slave Appliances to be disconnected from mains electricity. E.g. Some TVs have a 'Step Down Mode'.
- Usually turning on the power board takes two clicks of the TV remote. Occasionally a single click of the TV remote will activate the power board and turn the TV On.

Initial Set-Up

It is important you follow the sequence and timing of the Initial Set-Up accurately.

1. Turn off all AV appliances and remove from existing power sockets.
2. Plug into:
 - Normal Socket - Any recording device or any device that you do not wish to have turned off. *e.g. Pay TV, pre-programing devices etc.*
 - Master Socket – TV
 - Slave Sockets – Other devices you wish to save Standby Power. *e.g. DVD, VCR, Amplifier, etc*
3. Ensure the Infrared (IR) Receiver is fixed in direct view of the TV & associated remotes
4. Plug the Standby Power Controller (SPC) into the wall ensuring the wall socket is TURNED OFF
5. All within 5 seconds
 - Turn On the power at the wall socket
 - Turn On the TV by pressing the TV remote Twice (1st Press - turns SPC On, 2nd Press to turns TV On)

WAIT for at least 2 Minutes. DO NOT press any more buttons and leave your TV On. After approx 2 minutes the IR Receiver will flash 4 times. **Set-up is successful.**

(If this 4 flash does not happen, unplug the SPC from the wall, wait 1 minute and start again from step 1)
